

# WaxFrame

MANY MINDS, ONE REFINED RESULT.

## README

Multi-AI document refinement in your browser

# What WaxFrame is

---

WaxFrame Professional is a **browser-based, multi-AI document refinement tool**. A team of AI **Worker Bees** reviews and refines your document in iterative rounds. A designated **Builder AI** synthesizes the hive's feedback into each new version. You keep running rounds until the hive converges on a result it can no longer materially improve.

Every component runs in your browser. There is no backend, no database, no signup, no tracking, and no install — just one HTML page and its assets, served over HTTPS from a static host. Your API keys, prompts, and documents stay on your machine.

## WHY MULTI-AI?

A single AI gives you one perspective — one model's training data, one set of biases, one set of blind spots. A hive of AIs from different vendors (OpenAI, Anthropic, Google, xAI, Mistral, Perplexity, Together AI) surfaces genuine disagreements about your document, flags them as **Conflicts** for you to resolve, and converges on a stronger result than any single AI could produce alone.

## What you'll get out of it

---

- **Stronger first drafts.** Multiple AIs catch what a single AI misses — mixed metaphors, weak openings, factual gaps, structural problems.
- **Real disagreement, surfaced.** When two AIs disagree on a sentence, you see both versions and pick — instead of one AI's preference quietly winning.
- **Convergence as a stopping signal.** You stop running rounds when the hive stops suggesting material changes, not when you guess "this is probably good enough."
- **Your keys, your control.** Direct browser-to-provider calls with one documented exception (Claude). No middleman, no rate-limit games, no per-message surcharge.

# How it works

## The five-screen setup flow

| SCREEN                              | WHAT IT COLLECTS                                                                                                                                                      |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Worker Bees                      | Which AIs are in your hive this session. Add an API key per provider you want to enable; pick a model per AI; mark which AIs will participate.                        |
| 2. Builder                          | The single AI that synthesizes every round's reviewer feedback into the next document version. The Builder does the heaviest work each round.                         |
| 3. Your Project                     | Goal (what the document should accomplish), audience, document type, tone, scope, and any constraints. Templates can populate all six fields automatically.           |
| 4. Reference Material<br>(optional) | Source files the hive consults but never edits — existing brand docs, RFP source material, the article you're responding to. Supports DOCX, PDF, PPTX, XLSX, TXT, MD. |
| 5. Starting Document                | Upload an existing draft (DOCX / PDF / PPTX / XLSX / XLSM / TXT / MD), paste text, or start from scratch and let the hive write the first version.                    |

## Two modes

| MODE                     | WHEN TO USE IT                                                                                                                                                             |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Start from Scratch       | You have a goal but no draft yet, or your existing draft is heavily misaligned with the new goal. The hive writes a first version from your Project fields, then iterates. |
| Refine an Existing Draft | You have a draft that's directionally correct and needs improvement. Upload it (or paste) and the hive critiques and refines from there.                                   |

### TIP · MODE CHOICE MATTERS

If your existing draft is far from where you want to end up, refining it usually takes *more* rounds than starting fresh — the hive will burn early rounds debating the existing content instead of building toward the goal. When in doubt, start from scratch.

## A round, end to end

1

### You launch a round.

WaxFrame fires parallel requests to every reviewer AI in your hive.

2

### Reviewers respond.

Each returns a numbered list of specific suggestions, which you can watch streaming in the Live Console.

**3 The Builder reads all reviewer feedback**

and produces the next document version. It also extracts genuine disagreements between reviewers and flags them as **Conflicts**.

**4 You read the document and resolve Conflicts.**

For each conflict, you pick an option, write a custom resolution, or keep the original.

**5 Run the next round.**

Repeat until the hive converges — reviewers stop suggesting material changes.

# Document templates

WaxFrame ships with **23 built-in templates** across 6 categories. Each template pre-fills your Project fields with proven starting content for that document type, so you can launch your first round in seconds instead of writing setup copy from scratch.

| CATEGORY                  | TEMPLATES                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Quick Start               | Quick Start (chocolate-chip cookie recipe — low-stakes first-run)                                                                           |
| Career & Hiring           | Cover Letter · Résumé · Job Description · LinkedIn About · Thank-You Note                                                                   |
| Business & Sales          | Business Proposal · RFP Response · Executive Summary · Pitch Deck Outline · Email Campaign                                                  |
| Content & Marketing       | Blog Post · Press Release · Landing Page Copy · Product Description                                                                         |
| Personal & Everyday       | Personal Statement · Wedding Speech · Letter of Recommendation                                                                              |
| Reviews & Recommendations | Product Review · Restaurant Review · Hotel Review · Business / Service Review · Trim to TripAdvisor · Trim to Google Maps · Rewrite as Yelp |

## Custom templates

You can save any finished WaxFrame project as a custom template for reuse. The saved template captures your Project fields, reference material, and (optionally) your hive composition — so next time you start a similar project, you can apply it in one click and pick up from a known-good configuration.

# Supported AIs

WaxFrame is provider-neutral: you pick which AIs are in your hive based on what API keys you have. The pre-configured providers ship with sign-up links and validated endpoints. You can also add custom AIs that follow an OpenAI-compatible API shape.

| PROVIDER                  | NOTES                                                                                                                                      |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OpenAI (ChatGPT)</b>   | Direct browser-to-API. Paid; need at least \$5 in credits.                                                                                 |
| <b>Anthropic (Claude)</b> | Routes through a small Cloudflare Worker (Anthropic doesn't allow direct browser calls). Worker doesn't log keys or prompts. Paid.         |
| <b>Google (Gemini)</b>    | Direct. Has a free tier — usually the cheapest entry point.                                                                                |
| <b>xAI (Grok)</b>         | Direct. Paid.                                                                                                                              |
| <b>Mistral</b>            | Direct. Has a free tier with rate limits.                                                                                                  |
| <b>Perplexity</b>         | Direct. Paid.                                                                                                                              |
| <b>Together AI</b>        | Direct. Filters to callable serverless models. Paid.                                                                                       |
| <b>DeepSeek</b>           | Direct. Paid.                                                                                                                              |
| <b>Cohere</b>             | Direct. Has a free tier.                                                                                                                   |
| <b>Custom AI</b>          | Add any OpenAI-compatible API endpoint. Useful for self-hosted models, corporate gateways, or providers WaxFrame doesn't ship presets for. |

## TIP · BUILD A DIVERSE HIVE

Model-family diversity matters more than raw AI count. A hive of one OpenAI + one Anthropic + one Google model surfaces more genuine disagreement than three different OpenAI models. The Builder's job is harder, but the result is stronger.

## Minimum hive for real document work

At least **2 AIs** are required to run a round — you need at least one reviewer plus a Builder for the multi-AI dynamic to exist at all. The **3+ AI hive** (\$5 paid provider + free Gemini + one more paid provider, total ~\$10 in API credits) is the sweet spot: it converges faster and resolves more disagreements automatically before they reach your Conflicts panel.

# Privacy, security & licensing

---

## Where your data lives

---

- **API keys:** Saved to your browser's `localStorage`. Per-profile, per-machine. Never sent to WaxFrame; only sent to each AI provider when WaxFrame calls their API on your behalf.
- **Documents and prompts:** In your browser. The Builder and reviewers see them in-flight to do their work, but WaxFrame doesn't have a server that stores or logs anything.
- **Session state and history:** Stored in your browser's IndexedDB. Project history survives across browser sessions. Clearing browser data for the site removes it.
- **Backups:** When you save a backup, it's a JSON file written to your downloads folder. You control where it goes.

### ONE EXCEPTION · CLAUDE

Anthropic's API does not support direct browser calls (no CORS). Claude traffic routes through a tiny Cloudflare Worker operated by WaxFrame's developer at `waxframe-claude-proxy.weirdave.workers.dev`. The Worker forwards your request to Anthropic and returns the response. It does not log or persist your API key or prompt content, but it does see them in-flight while forwarding. All other providers connect directly browser-to-provider with no intermediary.

## Air-gap deployments

---

WaxFrame is air-gap safe. Every library it depends on is self-hosted in `lib/` (mammoth.js for DOCX, JSZip for ZIPs, SheetJS for XLSX/XLSM, pdf.js for PDFs, docx.js for Word export). No CDN dependencies. The whole app is one HTML page plus its CSS, JS, and asset files — copy the folder to your air-gapped network and it works.

## License

---

WaxFrame Professional is open source under **AGPL-3.0**. You can read the source, fork it, modify it, and run your own copy — the AGPL just requires that if you run a modified version as a service for others, you make your modifications available under the same license.

A paid **WaxFrame Pro** license is available at `weirdave.gumroad.com/l/WaxFrame` — supports the developer and unlocks unlimited rounds. The free version is fully functional for evaluating WaxFrame on real documents.
