WaxFrame README

Product overview

Version 3.32.7 · Build 20260503-023

Many minds.

One refined result.

WaxFrame is a browser-based multi-AI document collaboration tool. You bring the AIs; WaxFrame coordinates them.

One AI acts as the Builder, rewriting your document each round based on numbered suggestions from your Worker Bees.

No install. No server. No account. No data leaves your machine.

Overview

- Runs in your browser with no installation, no account, and no WaxFrame server.
- Supports both a free manual workflow and a Pro fully automated workflow.
- Lets multiple AI models collaborate in rounds, with one Builder and multiple Worker Bees.
- Includes 12 ready-to-use document templates (Cover Letter, Résumé, RFP Response, Recipe, and more) that pre-fill all six Project Goal fields with one click.
- Exports either a final text document or a full transcript of every round.

- Stores your session locally using IndexedDB, and sends data only to the AI providers you choose.

Privacy note: Your documents and API keys stay in your browser and go directly to the AI providers you choose. WaxFrame does not run its own backend or collect your content.

What is in this README

1. How It Works
2. Two Modes: Free vs Pro
3. Project Templates
4. Supported AIs
5. The Setup Screen
6. The Work Screen
7. Conflicts
8. Getting Started
9. API Keys
10. What Are Tokens?
11. Privacy
12. If something does not work

How It Works

13. **Set up your Hive.** Add API keys for the AIs you want to use and pick your Builder. You need at least two AIs to run a round.
14. **Describe your project.** Give it a name, version, and a detailed goal — or click 📋 **Use Template** to pre-fill all six Project Goal fields from a curated library of 12 document types. The more specific your goal, the better your results from round one.
15. **Start your document.** Upload a file (Word, PDF, PowerPoint, plain text, or Markdown), paste text, or let the hive generate a first draft from your goal.
16. **Smoke the Hive.** Every Worker Bee reads the document simultaneously and returns numbered suggestions. Your Builder reads all of them, applies the best ones, resolves disagreements, and rewrites the full document.
17. **Review conflicts.** When AIs disagree, the Builder flags it in the Conflicts panel rather than guessing. You pick the direction, or type your own, and that decision stays locked.
18. **Iterate.** Add notes before each round to steer the hive. Keep going as long as you want. When the document feels done, click Finish.

Export options: Export the final document as a .txt file, or export a Full Transcript containing every round, every AI response, and every document version.

> **Tip:** Your session is saved automatically using IndexedDB, so long multi-round sessions are preserved without size-limit headaches.

Two Modes: Free vs Pro

Free — Manual Workflow

No API keys are needed. WaxFrame generates the prompts for you. Open each AI in its own tab, copy the prompt in, paste the response back, and WaxFrame assembles the Builder prompt automatically. It works with any AI, including free tiers.

Pro — Fully Automated

One button does everything. Each AI needs its own API key. WaxFrame sends every prompt, collects every response, and runs the full round automatically with no copy/paste or tab switching.

Note: Three free rounds are included. A license key from weirdave.gumroad.com/l/WaxFrame unlocks unlimited rounds.

> **Tip:** Gemini's API is currently free. Pair it with one paid AI and fully automated rounds can be very inexpensive.

Project Templates

On the Project screen, click 📋 Use Template to populate all six Project Goal fields with proven starting content for a specific document type. WaxFrame ships with 12 templates organised into 5 categories.

Category	Templates
Quick Start	★ Quick Start (chocolate chip cookies — recommended for new users)
Career & Hiring	Cover Letter · Job Description · Résumé · Thank-You Letter
Business & Sales	Business Proposal · Email & Outreach · Executive Summary · RFP Response
Content & Marketing	Blog Post / Article · Presentation Outline
Personal & Everyday	Recipe

How template apply works. Click a card → if the Goal fields are empty, the template populates silently. If any field has content, a confirmation prompt warns that current entries will be replaced. Project name, version, length constraint, Reference Material, and Starting Document are never touched — only the six Goal fields.

Template Hint banner. Most templates contain `[bracketed]` placeholders the user must fill in (for example `[company name]` or `[job title]`). After applying a template with placeholders,

an amber-bordered banner appears above the Project Name with a per-field bulleted list telling you exactly which form field to look at and what to fix there. Templates that ship clean (Quick Start, Executive Summary) skip the banner entirely.

> **Tip:** New to WaxFrame? Click 📋 Use Template and pick ★ Quick Start — it is a low-stakes chocolate-chip-cookie example that converges in a few rounds and shows you the whole system end-to-end before you bring your real document.

Supported AIs

AI	Provider	Default model	Notes
ChatGPT	OpenAI	gpt-4.1	Excellent at high-volume document work
Claude	Anthropic	claude-sonnet-4-6	Large context and strong instruction following
Gemini	Google	gemini-2.5-flash	Free API tier available; great starting point
DeepSeek	DeepSeek	deepseek-chat	Very low cost per token; strong Builder
Grok	xAI	grok-4	Good context window
Perplexity	Perplexity	sonar-pro	Search-aware and useful as a reviewer
Custom	Any	Your choice	Any OpenAI-compatible API endpoint

Any AI can act as either a Worker Bee or Builder. Mix and match however you like.

The Setup Screen

Worker Bees (left panel)

Six public AI providers are listed. Click the API Key field next to any AI, paste your key, and press Enter. Every AI with a saved key becomes a Worker Bee that reviews the document and sends numbered suggestions each round.

Use + Add Custom AI to connect any AI with an OpenAI-compatible API endpoint, including internal enterprise deployments.

Builder (right panel)

The Builder is the AI that rewrites the document every round. It reads the full document plus every Worker Bee suggestion and produces the updated version. Choose an AI with enough token capacity for your document size. You can change your Builder at any time without losing anything.

The Work Screen

- **The Hive** — your active Worker Bees, each showing real-time status as the round runs. Toggle individual AIs on or off between rounds.
- **Working Document** — your live document with line numbers. Edit directly between rounds so the hive stays coordinated.
- **Conflicts** — anything the Builder could not resolve on its own is flagged here. User Decisions need your input; Builder Decisions show what the Builder chose.
- **Live Console** — shows which AIs are sending, responding, succeeding, or failing, along with timestamps and response previews.

Conflicts

When AIs disagree, the Builder flags it instead of making an arbitrary call.

- **User Decision** — the Builder found competing suggestions and needs you to choose. Pick one of the AI-generated options, type your own, bypass if you already edited the document directly, or decline. Your decision stays locked, so the AIs will not raise it again.
- **Builder Decision** — the Builder made a judgment call on your behalf. Review what it chose. If you disagree, select a different option or type your own and hit Apply.

> **Tip:** Click the “Current:” text on any conflict card to jump directly to that line in the working document.

Getting Started

WaxFrame runs entirely in your browser — no install, no server, and no account required. Desktop and laptop computers are supported; mobile phones are not currently supported.

- **Hosted version:** weirdave.github.io/WaxFrame-Professional
- **Run locally:** download the ZIP from GitHub, unzip it, and open index.html in your browser.
- For a step-by-step local setup guide, see *WaxFrame-Getting-Started.pdf* in the ZIP.

First time? Run Quick Start.

On the Project screen, click 📋 Use Template, then click the ★ Quick Start card (it is at the top, marked "Start Here"). On the Starting Document screen, click 💡 Start from Scratch. Click Launch and run a few rounds.

Quick Start is a chocolate-chip-cookie recipe — low stakes, converges fast, and walks you through the whole flow end-to-end before you bring your real document.

API Keys

Each AI in Pro mode needs its own key from that provider. Keys are stored in your browser's localStorage and never leave your machine.

If a provider link changes, open the Provider Links or API Key Guide inside WaxFrame for the latest URLs and billing links.

AI	Sign up at	Notes
Gemini	aistudio.google.com/apikey	Free tier; no credit card needed to start
ChatGPT	platform.openai.com/api-keys	Pay as you go; no monthly minimum
Claude	console.anthropic.com/settings/keys	Pay as you go; no monthly minimum
DeepSeek	platform.deepseek.com/api_keys	Very low cost per token
Grok	console.x.ai	xAI account required
Perplexity	perplexity.ai/settings/api	Enable auto-billing at signup; see User Manual

Perplexity note: Enable auto-billing when you first sign up and set your monthly limit to $5. If your initial credit runs out without auto-billing active, Perplexity may require a larger top-up to reactivate.

What Are Tokens?

If you are using Pro mode, tokens matter — especially for your Builder. Every round, your Builder reads the entire document plus all Worker Bee suggestions and rewrites the full document.

- **Example:** on a 2,000-word document with 5 Worker Bees, a Builder call is roughly 8,000 to 12,000 tokens.
- **Cost guidance:** Gemini's free tier is a good zero-cost starting point. For paid options, DeepSeek is generally the most cost-effective Builder.

For the full breakdown, open the Token Guide inside the app.

Privacy

- No server. No backend. No tracking. No analytics.
- Your documents stay on your machine. Nothing is sent anywhere except directly to the AI providers you choose.
- Your API keys stay in your browser. Stored in localStorage, they go directly to each provider; WaxFrame never sees them.
- WaxFrame is open source under the AGPL-3.0 license. Source code, issues, and releases are at github.com/WeirDave/WaxFrame-Professional.

If something does not work

Common issue	What to check
Only one API key is entered	You need at least two saved AI keys to run a round, plus a selected Builder.
An API key is rejected	Copy the key again from the provider portal and paste it carefully. Make sure there are no extra spaces before or after it.
A provider does not respond	The provider may be having an outage, rate limit, or billing issue. Try another provider or try again later.
index.html does not open correctly	Use Open With and select Chrome, Edge, Firefox, or Safari. Also make sure the full WaxFrame folder stayed together after unzipping.
A provider link no longer matches this guide	Use the in-app API Key Guide or Provider Links page for the latest URLs.

Built by WeirDave (R David Paine III) with a lot of help from the hive.
